

ClarityOS

The modern EHR built exclusively for optometry.

Most EHR systems were built for general medicine and awkwardly adapted for eye care. ClarityOS is different — it was designed from scratch for the optometric exam room. Every workflow, every screen, every shortcut reflects how you actually see patients. Less clicking, fewer errors, and charts that are always ready for an audit.

documentation

7-Step

Guided sign-off
checklist

5 Roles

Staff see only what
they need

100%

Every chart is
audit-ready

Designed for California practices. Built for high-compliance environments everywhere.

THE OPPORTUNITY

Why Your Practice Deserves Better

If you're a California optometrist, you already know — documentation requirements are intense. Board of Optometry oversight, HIPAA, and the growing complexity of medical optometry (glaucoma co-management, diabetic eye care, TPA procedures) mean your EHR needs to do more than just store notes. It needs to keep you protected.

ClarityOS was built from day one for optometry — not retrofitted from a general medicine template. That means fewer workarounds, faster charting, and confidence that your documentation meets the standards your board and your payers expect.

FEATURE 01

Every Chart Is Audit-Ready the Moment You Sign It

The problem: Unsigned encounters, missing timestamps, and incomplete records create real liability during audits. Manual attestation steps are easy to skip or forget.

How ClarityOS helps:

- **Verified signer identity** — When you sign a chart, ClarityOS confirms exactly who you are using your staff profile, license number, and NPI. No generic signatures.
- **Tamper-proof timestamps** — The date and time of every signature are set by the server, not your computer's clock. They can't be altered after the fact.
- **Permanent lock** — Once signed, everything in the chart — vitals, findings, diagnoses — is locked. There's no "unsign" button. If you need to add something later, you create an addendum.
- **Nothing is ever deleted** — Even if a record is marked as removed, the original content is preserved with a timestamp. This satisfies HIPAA's 6-year retention requirement automatically.

✓ **Bottom line: Your auditor sees a clean, unbroken chain of signed records. No gaps, no questions.**

FEATURE 02

Document a Healthy Patient in Under 60 Seconds

The problem: For a patient with normal findings, you're still clicking through 5–8 dropdowns and text fields just to say "everything looks good." It's tedious and it adds up fast.

How ClarityOS helps:

- **One-click "All Normal"** — A single button marks every structure in a section as within normal limits. Anterior segment? One click. Posterior segment? One click. Done.
- **Easy abnormal documentation** — When something isn't normal, just pick the structure, choose the finding, and select which eye. Laterality is built right in.
- **Copy right eye to left** — If both eyes have the same finding, one button mirrors it. No double entry.
- **Structured and searchable** — Your findings are stored in a way that makes them easy to search, report on, and export later — not buried in free-text notes.

✓ **Bottom line: Save 3–5 minutes per normal exam. Over a 20-patient day, that's an hour back in your schedule.**

FEATURE 03

Your Patient's History Follows Them Automatically

The problem: Chronic conditions get re-entered every visit. Glaucoma suspect? Type it again. Diabetic retinopathy? Hunt for the ICD-10 code again. Past history gets buried in old notes.

How ClarityOS helps:

- **Persistent problem list** — Every active condition lives on a master list that travels with the patient from visit to visit. No more digging through old encounters.
- **One-click carry-forward** — See "Glaucoma suspect, OD" on the problem list? Click "Bring Forward" and it drops into today's chart — complete with the ICD-10 code, laterality, and severity.
- **No accidental duplicates** — If a condition is already in today's chart, the system shows "Added" instead of letting you add it twice.
- **Automatic updates** — Resolve a condition during today's visit? When you sign the chart, the master list updates on its own. The next provider sees the resolution without any extra steps.

✓ **Bottom line: Every encounter starts with full context. No more "What was the code for their glaucoma again?"**

FEATURE 04

Clean Claims, Fewer Denials

The problem: Missing laterality is the #1 reason optometry claims get denied. A code like "H40.11" gets bounced because the payer needs the full code with eye and severity. Resubmitting delays payment by 30–60 days.

How ClarityOS helps:

- **Code validation at entry** — ClarityOS checks every ICD-10 code the moment you enter it. If something's wrong, you'll know before it reaches your billing queue.
- **Laterality is built in** — OD, OS, or OU is a required field on every diagnosis. It's not something you have to remember to type in.
- **Severity captured at point of care** — Mild, moderate, or severe is recorded during the exam, not reconstructed later by your billing team.
- **Perfect carry-forward** — When a problem is brought forward from the master list, all the billing details come with it exactly. No transcription errors.

✓ **Bottom line: Claims go out right the first time. Your billers spend less time on resubmissions.**

FEATURE 05

Critical Alerts You Can't Miss

The problem: Elevated IOP can get buried in a vitals table. A tech records 24 mmHg, the doctor starts the exam, and nobody flags it until chart review.

How ClarityOS helps:

- **Always-visible alerts** — A persistent bar at the top of every encounter page shows key warnings — you see them before you even sit down at the slit lamp.
- **Automatic IOP flags** — Any reading over 21 mmHg triggers a warning badge, shown per eye, updating instantly when the tech saves vitals.
- **Everything in one place** — Drug allergies, critical medical history, and IOP alerts all appear in the same row. One glance, full picture.

✓ **Bottom line: You're informed from the very first moment of the encounter. Nothing slips through.**

FEATURE 06

Your Work Is Always Saved

The problem: You dictate three minutes of clinical notes, then accidentally close the browser tab. In most systems, all that work is gone. You're left retyping from memory.

How ClarityOS helps:

- **Automatic backup** — Every keystroke is continuously saved in the background. If your browser crashes or you accidentally hit refresh, your work is waiting for you when you come back.
- **"Are you sure?" guard** — If you try to close the tab with unsaved work, the browser asks you to confirm — catching the most common accident: Command+W or a stray click.
- **Smart deactivation** — Once you've signed and sealed the chart, the guard turns off. A finalized chart has nothing to lose, so you navigate freely.
- **No slowdowns** — The auto-save happens silently in the background. You'll never notice it running — there's zero delay while you type.

✓ **Bottom line: Dictate with confidence. Your work is protected no matter what happens.**

FEATURE 07

Enter Prescriptions Without Touching the Mouse

The problem: Entering a refraction with a mouse means clicking through 14+ fields. With a phoropter in one hand and a patient waiting, that's too slow.

How ClarityOS helps:

- **Full keyboard entry** — Tab through sphere, cylinder, axis, and add for each eye. Use arrow keys to adjust in standard 0.25 D steps.
- **Built-in guardrails** — Sphere and cylinder snap to quarter-diopter increments. Axis stays within 1–180 degrees. You can't enter an invalid value.
- **Multiple Rx types side by side** — Habitual, auto, manifest, cycloplegic, and final prescriptions all live on the same encounter. Compare them at a glance.
- **Complete before dispensing** — The system won't let you mark a final Rx without PD values. No incomplete prescriptions leave the office.

Your Patient Data Stays Yours — Period

The problem: With shared EHR systems, there's always a nagging question: "Could another clinic accidentally see my patients?" That should never be a concern.

How ClarityOS helps:

- **Complete data isolation** — Every clinic gets its own separate database space. Your data is physically walled off from every other practice. It's not just a filter — it's a wall.
- **Verified identity on every action** — Every time someone accesses your system, ClarityOS confirms who they are and which clinic they belong to before allowing anything.
- **Five staff roles with precise permissions** — Doctor, Technician, Receptionist, Admin, and Owner. Each role sees only what they need for their job — nothing more.

Who Sees What

Your staff only sees what's relevant to their job. This isn't optional — it's how the system works:

Role	What They Can Do	What They Can't Do
Doctor	Full clinical access — chart, diagnose, sign	N/A — full access
Technician	Enter vitals, pre-tests, auto-refraction	Can't view doctor's notes or sign charts
Receptionist	See demographics, insurance, schedule	Clinical data is completely hidden
Admin	Manage staff and practice settings	No access to patient charts
Owner	Full admin + clinical access if practicing	Can be configured as admin-only if non-clinical

This isn't just a visual restriction. If someone's role doesn't include access, the data simply isn't sent to their screen. There are no hidden buttons or workarounds.

Your Practice, Under Your Control

Managing your team should be simple. With ClarityOS, it is:

- **Add staff in seconds** — Invite a team member, pick their role, and they're ready to go. No IT department needed.
- **Owner + Doctor in one profile** — If you own the practice and see patients, you don't need two accounts. One login gives you full admin control and full clinical access, with your NPI linked to every chart you sign.

- **Change roles instantly** — Promote a tech? Their access updates everywhere, immediately. Someone leaving the practice? Revoke their access in one click.
- **Full activity log** — Every access event is recorded: who viewed what, when, and from where. If a question ever comes up during a HIPAA review, you have the answer ready.

Just Talk — The Chart Fills Itself

The problem: A single encounter can mean 40+ data entries across vitals, findings, diagnoses, prescriptions, and the SOAP note. Every minute you spend typing is a minute away from your patient.

How ClarityOS helps:

- **Speak naturally during the exam** — Say something like "IOP 14 and 16, acuity 20/25 both eyes, anterior segments clear, cup-to-disc 0.3 OU, impression glaucoma suspect" — and ClarityOS takes care of the rest.
- **SOAP note writes itself** — A complete, properly structured note appears on screen in real time as you speak. No waiting, no post-visit dictation.
- **Fields fill automatically** — While the note is being written, ClarityOS also populates your vitals, findings, and diagnosis fields. One dictation fills the whole chart.
- **Every change is tracked** — You can see exactly what the AI filled in and what was there before. Full transparency, always.

You Review Everything Before It's Final

AI should help you, not make decisions for you. Before any AI-suggested changes go into your chart, you see a clear side-by-side comparison:

- **See exactly what changed** — Old values are shown with a strikethrough, new suggestions are highlighted. Nothing is hidden.
- **Accept or reject one at a time** — Keep the IOP values but reject an incorrect axis? No problem. You control each field individually.
- **Diagnoses reviewed separately** — Each suggested ICD-10 code appears as its own item. Confirm or remove each one on its own.
- **Nothing changes until you say so** — Your original data stays exactly as it was until you hit "Accept." The AI never writes over your work without permission.

A Guided Checklist So Nothing Gets Missed

Rushing through sign-off with missing diagnoses or unreviewed alerts is how mistakes happen. ClarityOS walks you through a simple 7-step review before the chart is sealed:

Step	What Happens
1. Chief Complaint	Quick review of why the patient came in
2. Vitals Check	Highlights any IOP readings above 21 mmHg

3. Diagnoses	Can't proceed without at least one diagnosis on file
4. Final Rx	Side-by-side view of right and left eye prescriptions
5. Assessment & Plan	Brief note required — no blank sign-offs allowed
6. Attestation	Confirm the documentation is accurate and complete
7. Sign & Seal	Locks the chart permanently once all steps are satisfied

After you sign, every field locks permanently. A confirmation banner shows your name and timestamp. The chart is sealed, compliant, and ready for any review.

What's Here — and What's Coming

Phase	Feature	Status
Phase 1	Core EHR — Vitals, refractions, exam findings, diagnoses, problem list, sign-off	Complete
Phase 2	AI Scribe — Speak during the exam, chart fills automatically	Complete
Phase 2	AI Review — See and approve every change the AI suggests	Complete
Phase 2	Sign & Seal — Guided 7-step chart finalization	Complete
Phase 2	Scheduling — Appointment booking, check-in, and daily calendar	Complete
Phase 2	Optical Queue — Track dispensing with Rx change alerts	Complete
Phase 2	Patient detail page with Rx history and visit timeline	Planned
Phase 3	Device integration — Import OCT and visual field data directly	Planned
Phase 3	Data export — Share patient records with other systems	Planned
Phase 4	Patient portal — Online booking, Rx lookup, secure messaging	Planned
Phase 4	Billing integration — Submit claims and process payments	Planned

The Bottom Line

ClarityOS doesn't ask you to change how you practice. It fits the way you already work — the way you examine patients, the way you document findings, the way you run your office — and makes all of it faster, safer, and easier to manage.

Less time charting. Fewer claim denials. Zero audit anxiety.

Built for the exam room. Designed for your peace of mind. Ready when you are.
